5 **CRL LAST CHANGED EXTENSION OR ATTRIBUTE**  
6  
7  
8

9 **FIELD OF THE INVENTION**

10 This invention relates generally to the field of digital certificates and  
11 certificate revocation lists (CRL). More particularly, this invention relates to a  
12 method and apparatus for providing an extension to a standard CRL that informs  
13 the recipient if changes have or have not been made since the last CRL.  
14

15 **BACKGROUND OF THE INVENTION**

16 Digital certificates are in wide use on the Internet and in the field of  
17 electronic commerce for authentication of all sorts of electronic transactions. In  
18 general, such digital certificates are used to certify the identity of an entity in the  
19 digital world, particularly as defined by the public key infrastructure (PKI). As digital  
20 certificates are issued and used, they often are either revoked or expire after a  
21 predetermined amount of time. In other situations, a digital certificate may be  
22 revoked or placed on hold pending some event. In order for digital certificates to  
23 be useful, it is important that those entities using digital certificates to authenticate  
24 the identity of an entity presenting the digital certificate have confidence that the  
25 digital certificate is valid. Generally, the validity of a digital certificate can be  
26 determined by reference to a Certificate Revocation List (CRL) produced by an  
27 authority that generates the certificates (usually a Certificate Authority).

28 **FIGURE 1** depicts a simple exemplary computer network 100 that utilizes  
29 a digital certificate and a Certificate Revocation List. In system 100, a user terminal

1 104 may request via a network (for example the Internet) 108, a digital certificate  
2 from a Certificate Authority 112. The Certificate Authority 112 generates and issues  
3 the certificate, which is returned to the user terminal 104. The user terminal 104  
4 can then utilize the digital certificate to carry out the transaction with another entity  
5 such as remote server 116. Such transactions may include financial transactions  
6 or any other transaction in which the identity of the user terminal 104 should be  
7 reliably authenticated.

8 When user terminal 104 sends the digital certificate to remote server 116,  
9 the remote server 116 can inspect the digital certificate against a list of revoked  
10 certificates (the Certificate Revocation List) stored by the remote server 116. In the  
11 event remote server 116 has not obtained a recent CRL, one can be requested from  
12 the Certificate Authority 112. Certificate Authority 112 then either generates a new  
13 CRL or sends the most recently generated CRL to the remote server 116. Remote  
14 server 116 can then determine whether or not the digital certificate sent by user  
15 terminal 104 is valid. Thus, remote server 116 can authenticate the user terminal  
16 104 and determine whether or not to authorize particular transaction at hand.

17 **FIGURE 2** depicts a message flow diagram 200 for the transaction just  
18 described. In this message flow diagram, a certificate request 204 is sent from the  
19 user terminal 104 to the Certificate Authority 112. The Certificate Authority 112  
20 generates a certificate at 208 and returns the certificate at 212 to the user terminal  
21 104. The user terminal 104 can then submit a transaction using the certificate at  
22 218 to the remote server 116. Remote server 116 can then request a new CRL at  
23 222 of the Certificate Authority. The Certificate Authority 112 then generates or  
24 retrieves a CRL at 226 and sends the CRL to the remote server 116 at 230.  
25 Depending on the nature of the transaction, the remote server 116 may process the  
26 CRL at 232 by taking various actions including, for example, sorting, filtering or  
27 reformatting the CRL and storing information in its own database. At 234, the  
28 certificate can be authenticated against the CRL data at the remote server 116. At  
29 238 the transaction can be either approved or rejected in accordance with the  
30 authentication at 234 and at 242 the approval or rejection can be confirmed with the

1 user terminal 104. Those skilled in the art will recognize that many other message  
2 flows are possible with the message flow 200 if **FIGURE 2** being intended as  
3 exemplary of a simple use of a digital certificate and a Certificate Revocation List.

4 With reference to **FIGURE 3** the Certificate Authority 112 may generate the  
5 Certificate Revocation List in accordance with process 300. CRLs are generated  
6 at the Certificate Authority either on a periodic basis, or as a result of some event  
7 such as a certificate is revoked, or some combination thereof. The process starts  
8 at 302 after which a database of certificates is queried for certificates meeting a  
9 particular criteria of inactivity. One example is for the query to request all  
10 certificates that have been revoked. Other certificates are assumed to still be valid  
11 and active.

12 At 304 the certificate database at the Certificate Authority responds to the  
13 query with certificates meeting the specified criteria. Header information is then  
14 generated, for example, in accordance with X.509 and RFC 2459 standards (or  
15 other applicable CRL standards) at 312 and at 316 the certificate is formatted (for  
16 example, as an ASN.1 or other format CRL). The digital certificate is signed at 320  
17 to assure its authenticity and is then stored at 322 within a computer residing at the  
18 Certificate Authority. The process returns at 326. Whenever a request is made for  
19 a new digital certificate, process 300 is carried out or, in some instances, the most  
20 recently generated CRL may be retrieved and forwarded to the requester.

21 When a CRL as generated in accordance with process 300 is sent to the  
22 remote server as in 232 of process 200, the remote server may carry out any  
23 number of processes on the CRL at 232. Such processes may include merging the  
24 CRL into existing databases, reformatting the CRL or taking other potentially  
25 computationally intensive actions. When a process such as process 300 is carried  
26 out at specified time intervals, it is possible that there has been no change in the  
27 CRL since the last CRL was sent to remote server 116. In this case, such  
28 processes at 232 are redundant and wasteful. It is therefore desirable to minimize

1 or eliminate such processing to allow the network to carry out its functions in a  
2 responsive manner.

3 As digital certificates find wider use, the number of such certificates issued  
4 has increased dramatically. With this increase comes an associated increase in  
5 the number of entries in a Certificate Revocation List. Accordingly, the processing  
6 at 232 as just described can become an extremely time consuming process,  
7 depending on the nature of the processing required. This is obviously undesirable  
8 since the process of authentication using the CRL should preferably be carried out  
9 in an expedient manner.

### 11 SUMMARY OF THE INVENTION

12 The present invention relates generally to digital certificates and certificate  
13 revocation lists. Objects, advantages and features of the invention will become  
14 apparent to those skilled in the art upon consideration of the following detailed  
15 description of the invention.

16 In one embodiment consistent with the present invention, a method and  
17 apparatus for generating a CRL with a last\_changed extension. When sequential  
18 CRLs are generated there is the potential that there will be no changes in the data  
19 associated with the CRL. In this case a recipient of the new CRL may needlessly  
20 perform processing on the new CRL. A CRL consistent with embodiments of the  
21 present invention provides an extension to specify the CRL number of the  
22 last\_changed CRL. This provides the recipient with information to determine  
23 whether the new CRL should be processed or the existing data is up to date,  
24 advantageously saving processing time if no new processing is required.

25 A method of creating a digital certificate revocation list (CRL) in a manner  
26 consistent with an embodiment of the present invention includes creating a list of  
27 digital certificates satisfying at least one inactive criterion; identifying a latest CRL  
28 in which changes have been made to the list; and storing an identity of the latest  
29 CRL in which changes have been made as a part of the CRL.

30 A method of using a digital certificate revocation list (CRL), in a manner

1 consistent with an embodiment of the present invention, includes storing a first  
2 CRL, the first CRL comprising at least a list of digital certificates satisfying at least  
3 one inactive criterion and a first CRL identifier ; carrying out a processing operation  
4 on the first CRL; receiving a second CRL, the second CRL comprising at least a list  
5 of digital certificates satisfying the at least one inactive criterion, a second CRL  
6 identifier and an identity of a latest CRL having differences with the list of  
7 certificates satisfying the at least one inactive criterion; and carrying out the  
8 processing operation on the second CRL only if the identity of the latest CRL having  
9 differences with the list of certificates satisfying the at least one inactive criterion  
10 is more recent than the first CRL.

11 A data structure consistent with an embodiment of the present invention,  
12 stored on a computer readable storage medium or transported over an electronic  
13 communication medium, for a digital certificate revocation list (CRL), includes a list  
14 of digital certificates satisfying at least one inactive criterion; a CRL identifier; and  
15 an identity of a latest CRL having differences with the list of digital certificates  
16 satisfying the inactive criterion.

17 The above summaries are intended to illustrate exemplary embodiments of  
18 the invention, which will be best understood in conjunction with the detailed  
19 description to follow, and are not intended to limit the scope of the appended  
20 claims.

## 21 22 **BRIEF DESCRIPTION OF THE DRAWINGS**

23 The features of the invention believed to be novel are set forth with  
24 particularity in the appended claims. The invention itself however, both as to  
25 organization and method of operation, together with objects and advantages  
26 thereof, may be best understood by reference to the following detailed description  
27 of the invention, which describes certain exemplary embodiments of the invention,  
28 taken in conjunction with the accompanying drawings in which:

29 **FIGURE 1** illustrates a simple exemplary system using digital certificates.

1           **FIGURE 2** is a signal flow diagram describing one use of a digital certificate  
2 and certificate revocation list in the system of **FIGURE 1**.

3           **FIGURE 3** is a flow chart describing generation of a CRL.

4           **FIGURE 4** is a flow chart describing one method consistent with an  
5 embodiment of the present invention for generation of a CRL having a  
6 Last\_Changed field as an extension.

7           **FIGURE 5** is a flow chart depicting processing of a CRL at the server 116 in  
8 accordance with an embodiment consistent with the present invention.

9           **FIGURE 6** illustrates a computer system suitable for use in conjunction with  
10 embodiments of the present invention.

## 11 12                           **DETAILED DESCRIPTION OF THE INVENTION**

13           In the following detailed description of the present invention, numerous  
14 specific details are set forth in order to provide a thorough understanding of the  
15 present invention. However, it will be recognized by one skilled in the art that the  
16 present invention may be practiced without these specific details or with  
17 equivalents thereof. In other instances, well known methods, procedures,  
18 components, and circuits have not been described in detail as not to unnecessarily  
19 obscure aspects of the present invention.

## 20 21                           **NOTATION AND NOMENCLATURE**

22           Some portions of the detailed descriptions which follow are presented in  
23 terms of procedures, steps, logic blocks, processing, and other symbolic  
24 representations of operations on data bits that can be performed on computer  
25 memory. These descriptions and representations are the means used by those  
26 skilled in the data processing arts to most effectively convey the substance of their  
27 work to others skilled in the art. A procedure, computer executed step, logic block,  
28 process, etc., is here, and generally, conceived to be a self-consistent sequence  
29 of steps or instructions leading to a desired result. The steps are those requiring

1 physical manipulations of physical quantities.

2 Usually, though not necessarily, these quantities take the form of electrical  
3 or magnetic signals capable of being stored, transferred, combined, compared, and  
4 otherwise manipulated in a computer system. It has proven convenient at times,  
5 principally for reasons of common usage, to refer to these signals as bits, values,  
6 elements, symbols, characters, terms, numbers, or the like.

7 It should be borne in mind, however, that all of these and similar terms are  
8 to be associated with the appropriate physical quantities and are merely convenient  
9 labels applied to these quantities. Unless specifically stated otherwise as apparent  
10 from the following discussions, it is appreciated that throughout the present  
11 invention, discussions utilizing terms such as "processing" or "sending" or  
12 "receiving" or "authenticating" or "generating" or "determining" or "displaying" or  
13 "recognizing" or the like, refer to the action and processes of a computer system,  
14 or similar electronic computing device, that manipulates and transforms data  
15 represented as physical (electronic) quantities within the computer system's  
16 registers and memories into other data similarly represented as physical quantities  
17 within the computer system memories or registers or other such information  
18 storage, transmission or display devices.

19  
20 **CRL LAST CHANGED EXTENSION OR ATTRIBUTE IN ACCORDANCE WITH**  
21 **THE INVENTION**

22 While this invention is susceptible of embodiment in many different forms,  
23 there is shown in the drawings and will herein be described in detail specific  
24 embodiments, with the understanding that the present disclosure is to be  
25 considered as an example of the principles of the invention and not intended to limit  
26 the invention to the specific embodiments shown and described. In the description  
27 below, like reference numerals are used to describe the same, similar or  
28 corresponding parts in the several views of the drawings.  
29

1 It is desirable to minimize or eliminate the processing of a CRL that has not  
2 changed since the most recently received CRL. Currently, there is no main  
3 mechanism for accomplishing this. The present invention utilizes an extension to  
4 the standard CRL format to introduce a field referred to herein as "last\_changed".  
5 This field indicates provides an identifier of the CRL (i.e., the CRL number) of the  
6 last CRL that has been changed since the current CRL.

7 In order to implement this change in one embodiment, process 400 in  
8 **FIGURE 4** is utilized starting at 402. At 404 an integer N and the variable  
9 last\_changed are both initialized at a value of 1. At 408, CRL #1 is generated,  
10 signed and saved using a technique such as data process 300 of **FIGURE 3** or any  
11 other suitable process. A timer is then initialized at 412 and the value of the  
12 counter N is incremented by 1 at 416. The timer initialized at 412 is utilized to  
13 establish the periodic time intervals between generation of new Certificate  
14 Revocation Lists. The timer is inspected at 420 to determine if it has expired and  
15 the process awaits expiration of the timer at 420.

16 When the timer has expired at 420, CRL #N is generated at 424. At 430, the  
17 data entries listing the revoked certificate numbers in CRL #N are prepared to those  
18 entries in CRL #N-1 to determine if any change has taken place. If any change has  
19 taken place, those entries will be unequal and control passes to 434. At 434 the  
20 value of last\_changed is updated to N and CRL #N. CRL #N is then signed at 438  
21 with a digital signature and saved at 442. The timer is then reset at 446 and control  
22 returns to 416 where the value of N is incremented and the process repeats.

23 In the event CRL #N's data is equal to the data at CRL #N-1 at 430, 434 is  
24 skipped and the process proceeds to 438 where the CRL #N is signed, saved at  
25 442 and the timer is reset at 446. In this manner, the value of last\_changed is  
26 incremented whenever there is a change in two adjacently generated certificate  
27 revocation lists. Thus, when terminal 116 receives a new CRL, it can determine  
28 whether or not processing should be carried out in the new CRL by simply reading

1 the value of last\_changed. This is depicted in connection with **FIGURE 5** as  
2 process 500.

3 Process 500 of **FIGURE 5** starts at 502 after which a request is sent to the  
4 Certificate Authority at 222. At 230, CRL is received from this Certificate Authority.  
5 In one embodiment, once the portion of the CRL containing the last\_changed is  
6 received, the remaining portion of the CRL can be ignored or rejected. In other  
7 embodiments the entire CRL is received at 230. At 512, the value of last\_changed  
8 is compared to the CRL number of the most recently saved CRL at the server 116.  
9 If last\_changed is greater than the CRL number of the most recently saved CRL at  
10 512, then the new CRL is saved at 516 (or, if necessary, the remainder is first  
11 received) and a new CRL is processed at 232 and the certificate is authenticated  
12 at 234 before returning at 530. In the event the value of last\_changed is not greater  
13 than the CRL number of the most recently saved CRL at 512, 516 and 232 can be  
14 skipped and the process proceeds directly to authentication using the previously  
15 received CRL (whose data has not been changed). In this manner, the process in  
16 232 of the new CRL can be avoided if there is no change in the data between the  
17 most recently received CRL and the current CRL at server 116.

18 Referring now to **FIGURE 6**, the process of **FIGURE 4** can be carried out at  
19 the certificate authority using a computer system such as that illustrated in **FIGURE**  
20 **6** as 600. Similarly, the process of **FIGURE 5** can be carried out in a computer  
21 system such as 600 in server 116. Computer system 600 includes a central  
22 processor unit (CPU) 610 with an associated bus 615 used to connect the central  
23 processor unit 610 to Random Access Memory 620 and Non-Volatile Memory 630  
24 in a known manner. An output mechanism at 640 may be provided in order to  
25 display or print output for the computer administrator. Similarly, input devices such  
26 as keyboard and mouse 650 may be provided for the input of information from the  
27 computer administrator. Computer 600 also may include disc storage 660 for  
28 storing large amounts of information such as the list of certificates issued and the  
29 most recent Certificate Revocation List as well as any other information as

1 required. Computer system 600 is coupled to the network (e.g., the Internet) using  
2 a network connection 670 such as an Ethernet adapter coupling computer system  
3 600 through a fire wall and/or locally a network to the Internet.

4 Those skilled in the art will recognize that the present invention has been  
5 described in terms of exemplary embodiments based upon use of a programmed  
6 processor. However, the invention should not be so limited, since the present  
7 invention could be implemented using hardware component equivalents such as  
8 special purpose hardware and/or dedicated processors which are equivalents to  
9 the invention as described and claimed. Similarly, general purpose computers,  
10 microprocessor based computers, micro-controllers, optical computers, analog  
11 computers, dedicated processors and/or dedicated hard wired logic may be used  
12 to construct alternative equivalent embodiments of the present invention.

13 Those skilled in the art will appreciate that the program steps used to  
14 implement the embodiments described above can be implemented using disc  
15 storage as well as other forms of storage including Read Only Memory (ROM)  
16 devices, Random Access Memory (RAM) devices; optical storage elements,  
17 magnetic storage elements, magneto-optical storage elements, flash memory, core  
18 memory and/or other equivalent storage technologies without departing from the  
19 present invention. Such alternative storage devices should be considered  
20 equivalents.

21 The present invention is preferably implemented using a programmed  
22 processor executing programming instructions that are broadly described above in  
23 flow chart form, and that can be stored in any suitable electronic storage medium  
24 or that can be transmitted over any electronic communication medium. However,  
25 those skilled in the art will appreciate that the processes described above can be  
26 implemented in any number of variations and in many suitable programming  
27 languages without departing from the present invention. For example, the order of  
28 certain operations carried out can often be varied, and additional operations can be  
29 added without departing from the invention. Error trapping can be added and/or  
30 enhanced and variations can be made in user interface and information

1 presentation without departing from the present invention. Such variations are  
2 contemplated and considered equivalent.

3 While the invention has been described in conjunction with specific  
4 embodiments, it is evident that many alternatives, modifications, permutations and  
5 variations will become apparent to those skilled in the art in light of the foregoing  
6 description. Accordingly, it is intended that the present invention embrace all such  
7 alternatives, modifications and variations as fall within the scope of the appended  
8 claims.

9 What is claimed is:  
10
